The editor wishes to thank all Drinking Water Organics Section staff who helped to realize this report by providing experimental data and valuable comments.

## TABLE OF CONTENTS

Introduction	.....	1
The Determination of Trihalomethanes in Water by Purge-and-Trap / Gas Chromatography ( OPTM-E3237A.1 )	.....	3
The Determination of Purgeable Organic Compounds in Potable and Surface Waters by P&T/GC/FID and ECD ( OPOV-E3144A.1 )	.....	9
The Determination of Organochlorine Pesticides, Poly- chlorinated Biphenyls and Other Chlorinated Organic Compounds in Water by GC-ECD ( OWOC-E3120A.1 )	.....	39
The Determination of Chlorophenols and Phenoxyacid Herbicides in Water by Solid Phase Extraction and GC-ECD ( OWCP-B-E3119A.1 )	.....	47
The Determination of Organophosphorous Pesticides in Water by GC-TSD ( PWAOP-E3224A.1 )	.....	52
The Determination of Polynuclear Aromatic Hydrocarbons in Surface Water, Drinking Water and Groundwater by HPLC ( HPLC/L-E3086A.1 )	.....	57
The Determination of Carbamates in Water by HPLC ( PWACAR-E3185A.1 )	.....	62
The Determination of Triazine Herbicides in Water by GC-TSD ( OWTRI-E3121A.1 )	.....	67
The Determination of Phenyl Ureas in Water by High Performance Liquid Chromatography ( PWAUH-E3230A.1 )	.....	72
The Determination of Polychlorinated Dibenzo-p-dioxins and Poly- chlorinated Dibenzofurans in Ambient Air ( PAAFD-E3123A.1 )	.....	74
The Determination of Polychlorinated Dibenzo-p-dioxins and Poly- chlorinated Dibenzofurans in Fish Tissue ( PFAFD-E3135A.1 )	.....	82
The Determination of Polychlorinated Dibenzo-p-dioxins and Poly- chlorinated Dibenzofurans in Soil and Sediment ( PSAFD-E3152A.1 )	.....	90

## INTRODUCTION

This document represents the first publication of an annual summary of the performance of routine approved analytical methods within the laboratories of Drinking Water Organics Section.

The Drinking Water Organics Section is responsible for both qualitative and quantitative analyses of drinking, surface, river and lake waters for a wide array of organic chemicals, such as chlorinated benzenes, herbicides, pesticides, polynuclear aromatic hydrocarbons, extractable organics and purgeable organics at the part-per-trillion or part-per-billion level. In addition, analyses provided by the Section include ultra-trace quantitative analyses of environmental matrices for polychlorinated dibenzodioxins and polychlorinated dibenzofurans, most notably 2,3,7,8-tetrachlorodibenzo-p-dioxin. Also, DWO Section supports various Ministry's programs by providing characterization of unknown organic contaminants by mass spectrometry.

The major objective of the DWO Section's quality assurance program is to produce data of known quality, appropriate for a particular purpose. The quality control program is designed to detect any anomalies in the quality of the analytical results and to provide the basis for an immediate corrective action.

Within the DWO Section, the most common quality control tasks include the analyses of quality control samples, such as method blanks, fortified method blanks, samples fortified with surrogates, check calibration solutions and reference materials, and the interpretation of the resulting data. For each analytical method, the actual quality control procedures are described in detail in section 6.2 of the corresponding official method text.

This Performance Summary Report is based on the results of selected quality control samples acquired between January and December, 1991. In this report, each abstract of the analytical method is accompanied by corresponding performance charts and summary tables. Performance charts contained indicate the mean and the 99%-confidence limits for the variable presented.

**METHOD CODE :** OPTM-E3237A.1  
**METHOD TITLE:** The Determination of Trihalomethanes in Water by Purge-and-Trap/Gas Chromatography

**LABORATORY :** Priority Pollutants Unit  
**SUPERVISOR :** O.W. Berg

**SAMPLE TYPE :** surface water, groundwater, finished drinking water

**PRINCIPLE OF THE METHOD :**

Trihalomethanes are purged from an aqueous sample onto an adsorption trap, and subsequently, thermally desorbed onto a gas chromatographic capillary column. After separation, the organics are identified and quantified by Hall electrolytic conductivity detector.

PARAMETERS MEASURED :	LIS TEST CODE :	W ( µg/L )	T ( µg/L )
Chloroform	X1005J	0.5	5.0
Bromodichloromethane	X1010J	0.2	2.0
Dibromochloromethane	X1011J	0.2	2.0
Bromoform	X1015J	0.2	2.0
Total THM's	X2TTHM	0.5	5.0

**REPORTING FORMAT :**

Results are reported in parts per billion (µg/L) rounded off to the closest increment of W and up to maximum of three significant figures.

**QUALITY CONTROL :**

The routine quality control samples are designed to verify absence of potential contamination (method blanks) and to monitor validity of calibration (calibration solutions) and the agreement with the established method precision and accuracy (laboratory replicate samples, reference material).

The results for the analysis of calibration solution and the analysis of reference material have their control limits statistically derived.

**REMARKS :** In addition to the intra-laboratory method control, the performance of the method was examined through performance audit samples program organized by LSB Quality Management Office.

Method Blanks Summary

January 1991 - December 1991

Analyte	Number of Observations	Average Concentration ( µg/L )	Standard Deviation ( µg/L )
chloroform	106	0.05	0.23
bromodichloromethane	106	0	0
dibromochloromethane	106	0	0
bromoform	106	0	0
THM's - total	106	0.05	0.23

CHLOROFORM  
recovery from fortified blank

Performance Summary Table

January - December 1991

Analyte	chloroform
True Concentration	20 µg/L
Number of Observations	91
Within-run Rel. Standard Deviation	4% ( n=13 )
Between-run Standard Deviation	10%
Accuracy (% of expected)	107%

BROMODICHLOROMETHANE  
recovery from fortified blank

Performance Summary Table

January - December 1991

Analyte	bromodichloromethane
True Concentration	20 µg/L
Number of Observations	91
Within-run Rel. Standard Deviation	5% ( n=13 )
Between-run Standard Deviation	7%
Accuracy (% of expected)	102%

Performance Summary Table                      January - December 1991

Analyte	dibromochloromethane
True Concentration	20 µg/L
Number of Observations	91
Within-run Rel. Standard Deviation	5% ( n=13 )
Between-run Standard Deviation	8%
Accuracy (% of expected)	103%

Performance Summary Table

January - December 1991

Analyte	bromoform
True Concentration	10 µg/L
Number of Observations	91
Within-run Rel. Standard Deviation	6% ( n=13 )
Between-run Standard Deviation	11%
Accuracy (% of expected)	108%

**METHOD CODE :** OPOV-E3144A.1  
**METHOD TITLE:** The Determination of Purgeable Organic Compounds in Potable and Surface Waters by GC-FID and ECD

**LABORATORY :** Priority Pollutants Unit  
**SUPERVISOR :** O.W. Berg

**SAMPLE TYPE :** surface water, groundwater, finished drinking water

# **PRINCIPLE OF THE METHOD :**

This method involves purge-and-trap gas chromatographic analysis with simultaneous flame ionization and electron capture detection. The volatile organics compounds are purged from aqueous phase onto a Tenax trap by a stream of helium gas. The compounds are then thermally desorbed and cryofocussed onto one-metre piece of deactivated fused silica transfer line using liquid nitrogen as the coolant. The cold trap is then rapidly heated by an electric current and the compounds are swept into the chromatographic column.

The chromatogram resulting from the FID is used for quantification, while the ECD chromatogram is used mainly for confirmation.

PARAMETERS MEASURED :	LIS TEST CODE :	W ( µg/L )	T ( µg/L )
1,1-dichloroethene	X1001P	0.1	1.0
dichloromethane	X1002P	0.5	5.0
t-1,2-dichloroethene	X1003P	0.1	1.0

o-xylene	B2006P	0.05	0.5
1,1,2,2-tetrachloroethane	X1016	0.2	2.0
1,4-dichlorobenzene	X2002P	0.1	1.0
1,3-dichlorobenzene	X2003P	0.1	1.0
1,2-dichlorobenzene	X2004P	0.1	1.0
total trihalomethanes	X2TTHM	0.5	5.0

#### REPORTING FORMAT :

Results are reported in parts per billion ( $\mu\text{g/L}$ ) rounded off to the closest increment of W and up to maximum of three significant figures.

#### QUALITY CONTROL :

The routine quality control operations monitor absence of potential interferences (method blanks) and consistency with the predetermined method performance ( fortified method blanks ).

**REMARKS :** This analytical method was modified in September 1991. The detection system was replaced with dual capillary gas chromatography with dual flame ionization detectors.

In addition to the intra-laboratory method control, the performance of the method was examined through performance audit samples program organized by LSB QM Office.

#### REPORTING FORMAT :

Results are reported in parts per trillion ( ng/L ) rounded off to the closest increment of W and up to maximum of two significant figures.

#### QUALITY CONTROL :

The routine quality control operations monitor validity of calibration ( calibration check solution ), absence of potential interferences ( method blanks ), overall method performance ( fortified method blanks ).

For selected target compounds, control charts summarizing the response factors used to calibrate instruments and the recoveries from fortified method blanks are maintained.

**REMARKS :** In addition to the intra-laboratory method control, the performance of the method was examined through performance audit samples program organized by LSB Quality Management Office.

**METHOD CODE :** OWCP-B-E3119A.1  
**METHOD TITLE:** The Determination of Chlorophenols and Phenoxyacid Herbicides in Water by Using Solid Phase Extraction and GC-ECD

**LABORATORY :** Organic Water Unit  
**SUPERVISOR :** C.D. Hall

**SAMPLE TYPE :** surface water, groundwater, finished drinking water

**PRINCIPLE OF THE METHOD :**

The aqueous sample is aspirated through C-18 bonded porous silica cartridge. The cartridge is eluted with a small volume of solvent. The eluate is methylated and the 2,4-D type herbicides and chlorophenols are determined as the corresponding methyl esters and ethers by dual capillary gas chromatography with electron capture detection.

PARAMETERS MEASURED :	LIS TEST CODE :	W ( ng/L )	T ( ng/L )
2,4,6-trichlorophenol	X3246	20	200
2,4,5-trichlorophenol	X3245	100	1 000

**REPORTING FORMAT :**

Results are reported in parts per trillion (ng/L) rounded off to the closest increment of W and up to maximum of two significant figures.

**QUALITY CONTROL :**

Quality control samples included in the run format are method blanks, fortified method blanks and calibration check solution.

For selected target compounds, control charts summarizing the response factors used to calibrate instruments and the recoveries from fortified method blanks are maintained.

**REMARKS :** In addition to the intra-laboratory method control, the performance of the method was examined through performance audit samples program organized by LSB Quality Management Office.

**METHOD CODE :** PAAFD-E3123A.1

**METHOD TITLE:** The Determination of Polychlorinated Dibenzo-p-dioxins (PCDD) and Polychlorinated Dibenzofurans (PCDF) in Ambient Air

**LABORATORY :** Dioxin Unit

**SUPERVISOR :** E. Reiner

**SAMPLE TYPE :** ambient air

**PRINCIPLE OF THE METHOD :**

Samples are collected using a MOE-modified high-volume air sampler with a polyurethane foam (PUF) plug and Teflon-coated glass fiber filter paper. PCDDs and PCDFs are extracted from the PUF and filter paper using a Soxhlet extraction apparatus and toluene. The concentrated extract is processed through a multi-stage chromatographic cleanup procedure to remove the bulk of the sample matrix and potential chemical interferences. After cleanup, the extract is evaporated to dryness.

The reconstituted extract is examined by gas chromatography - triple quadrupole tandem mass spectrometry (GC-MS-MS) or gas chromatography - high resolution mass spectrometry (GC-HRMS).

**PARAMETERS MEASURED :**

1,2,3,4,7,8,9-heptachlorodibenzofuran  
1,2,3,4,6,7,8,9-octachlorodibenzofuran

## REPORTING FORMAT :

Results are reported as pg/m<sup>3</sup> rounded off to 2 significant figures. The minimum reported levels are sample and analyte specific \* and range from 0.001 pg/m<sup>3</sup> to 0.01 pg/m<sup>3</sup>.

## QUALITY CONTROL :

The routine quality control operations monitor validity of calibration and consistency in injection volume ( injection standard ), absence of potential contamination ( blanks ) and recovery of target analytes ( internal standard ).

Prior to extraction, each sample is spiked with solution containing isotopically labelled dioxin standards. The recoveries of these isotopically labelled analytes ( at least one per each congener group ) are monitored. The range for acceptable recoveries is (25-150)%. For the recoveries outside this range, results are reported uncorrected for internal standard recovery.

**REMARKS :** The performance of the method was examined through CCME Interlaboratory Study PCDD/PCDF in Ambient Air.

Two types of performance limits are displayed on the performance charts. One set was statistically derived from 1991 data set; while the other set is adopted from U.S. EPA method 1613.

List of Performance Charts : <sup>13</sup>C<sub>12</sub>-Tetrachlorodibenzo-p-dioxin ( recovery of internal standard )

**METHOD CODE :** PFAFD-E3135A.1

**METHOD TITLE:** The Determination of Polychlorinated Dibenzo-p-dioxins and Polychlorinated Dibenzofurans in Fish Tissue

**LABORATORY :** Dioxin Unit

**SUPERVISOR :** E. Reiner

**SAMPLE TYPE :** fish tissue and other biological tissue ( clams, shrimps )

**PRINCIPLE OF THE METHOD :**

Sample is homogenized by mechanical grinding. A homogeneous portion to be analyzed is fortified with isotopically labelled internal standard and is digested overnight with concentrated hydrochloric acid. The resulting solution is extracted with hexane and the extract is passed through a column containing anhydrous sodium sulphate and sulphuric acid-silica packing.

The extract is concentrated and subsequently fractionated using high performance liquid chromatography (HPLC). The reconstituted final extract is analyzed by gas chromatography - mass spectrometry or gas chromatography - triple quadrupole tandem mass spectrometry or gas chromatography - high resolution mass spectrometry.

**PARAMETERS MEASURED :**

( parameters measured continued )

1,2,3,4,7,8,9-heptachlorodibenzofuran  
1,2,3,4,6,7,8,9-octachlorodibenzofuran

## REPORTING FORMAT :

Results are reported as ppt ( picograms of CDD/CDF per gram of wet fish tissue ) rounded off to 2 significant figures. The minimum reported levels are sample and analyte specific \* and range from 1 pg/g to 10 pg/g.

## QUALITY CONTROL :

The routine quality control operations monitor validity of calibration and consistency in injection volume ( injection standard ), absence of potential contamination ( blanks ) and recovery of target analytes ( internal standard ).

Prior to extraction, each sample is spiked with solution containing isotopically labelled dioxin standards. The recoveries of these isotopically labelled analytes ( at least one per each congener group ) are monitored. The range for acceptable recoveries is (25-150)%. For the recoveries outside this range, the results are reported uncorrected for internal standard recovery.

**REMARKS :** Two types of performance limits are displayed on the performance charts. One set was statistically derived from 1991 data set; while the other set is adopted from U.S. EPA method 1613.

**METHOD CODE :** PSAFD-E3152A.1

**METHOD TITLE:** The Determination of Polychlorinated Dibenzo-p-dioxins (PCDD) and Polychlorinated Dibenzofurans (PCDF) in Soil and Sediment

**LABORATORY :** Dioxin Unit

**SUPERVISOR :** E. Reiner

**SAMPLE TYPE :** soil and sediment

**PRINCIPLE OF THE METHOD :**

Samples are dried, ground and homogenized. PCDD and PCDF are extracted from soil/sediment using a Soxhlet extraction apparatus and toluene. The concentrated extract is processed through a multi-stage chromatographic cleanup procedure to remove bulk of the sample matrix and potential chemical interferences.

The reconstituted final extract is analyzed by gas chromatography - mass spectrometry or gas chromatography - triple quadrupole tandem mass spectrometry or gas chromatography - high resolution mass spectrometry.

**METHOD CODE :** PWAFFD-E3163A.1

**METHOD TITLE:** The Determination of Polychlorinated Dibenzo-p-dioxins and Polychlorinated Dibenzofurans in Drinking Water by GC-MS

**LABORATORY :** Dioxin Unit

**SUPERVISOR :** E. Reiner

**SAMPLE TYPE :** raw or finished drinking water

**PRINCIPLE OF THE METHOD :**

Target analyte(s) are extracted from samples with an organic solvent. The extract is then cleaned of potential chemical interferences by two-stage column chromatography. Cleaned extract is evaporated to dryness. After reconstitution, the extract is examined by gas chromatography - mass spectrometry.

If the extract contains chemical interferences that prevent the quantification of target analytes, it is further fractionated using high performance liquid chromatography and then re-analyzed by GC-MS.

**PARAMETERS MEASURED :**

## REPORTING FORMAT :

Results are reported in parts per quadrillion ( pg/L ) rounded off to 2 significant figures. The minimum reported levels are sample and analyte specific \* and range from 1 ppq to 5 ppq.

## QUALITY CONTROL :

The routine quality control operations monitor validity of calibration and consistency in injection volume ( injection standard ), absence of potential contamination ( blanks ) and recovery of target analytes ( internal standard ).

Prior to extraction, each sample is spiked with solution containing isotopically labelled dioxin standards. The recoveries of these isotopically labelled analytes ( at least one per each congener group ) are monitored. The range for acceptable recoveries is (25-150)%. For the recoveries outside this range, the relevant results are reported uncorrected for internal standard recovery.

**REMARKS :** During the period starting January 1991 and ending December 1991, a total of ten method blanks was prepared and tested by the method. For these 10 analyses, no observable responses of any of the target analytes were encountered.

Two types of performance limits are displayed on the performance charts. One set was statistically derived from 1991 data set; while the other set is adopted from U.S. EPA method 1613.

## REPORTING FORMAT :

Results are reported in parts per quadrillion ( pg/L ) rounded off to 2 significant figures. The minimum reported levels are sample and analyte specific \* and range from 5 ppq to 10 ppq.

## QUALITY CONTROL :

The routine quality control operations monitor validity of calibration and consistency in injection volume ( injection standard ), absence of potential contamination ( blanks ) and recovery of target analytes ( internal standard ).

Prior to extraction, each sample is spiked with solution containing isotopically labelled dioxin standards. The recoveries of these isotopically labelled analytes ( at least one per each congener group ) are monitored. The range for acceptable recoveries is (25-150)%. For the recoveries outside this range, the results are reported not corrected for recovery of internal standard.

**REMARKS :** Two types of performance limits are displayed on the performance charts. One set was statistically derived from 1991 data set; while the other set is adopted from U.S. EPA method 1613.

List of Performance Charts : <sup>13</sup>C<sub>12</sub>-Tetrachlorodibenzo-p-dioxin ( recovery of internal standard )

**METHOD CODE :** NDMA-E3291A.1  
**METHOD TITLE:** The Determination of N-Nitrosodimethylamine (NDMA) in Drinking Water and in Aqueous Samples by Gas Chromatography / High Resolution Mass Spectrometry (GC/HRMS)

**LABORATORY :** Mass Spectrometry Unit  
**SUPERVISOR :** V. Taguchi

**SAMPLE TYPE :** drinking water, aqueous samples

**PRINCIPLE OF THE METHOD :**

Samples which contain particulate matter are filtered prior to analytical processing.

Sample pH is adjusted to 12 to keep the acidic components in the aqueous phase and the resulting solution is serially extracted with dichloromethane. The dichloromethane extract is washed with a sulphuric acid solution to remove basic components from the organic phase. After being filtered through granular anhydrous sodium sulphate to remove water the extract is concentrated by rotary evaporator and a nitrogen evaporating unit.

The final extract containing the remaining neutral components is analyzed by GC/HRMS. NDMA is quantified by an isotope dilution method.

PARAMETERS MEASURED :	LIS TEST CODE :	MDL (µg/L)
N-Nitrosodimethylamine	MSOBNO (NDMA)	0.005

**REPORTING FORMAT :**

Results are reported in µg/L rounded off to two significant figures. The lowest reported value is  $5 \times 10^{-3}$  µg/L.

**QUALITY CONTROL :**

The routine quality control operations monitor validity of calibration ( repetitive analysis of calibration standard ), size of potential positive bias ( method blanks ) and maintenance of required instrument sensitivity.

**REMARKS :** The performance of the method was examined through performance audit samples program and and MOE Interlaboratory Study # 91-2. Both programs were organized by LSB Quality Management Office.

**METHOD CODE :** SMY-E3186A.1  
**METHOD TITLE:** The Determination of Extractable Organics in Drinking Water, Aqueous Samples, Soil and Sediment by Gas Chromatography / Mass Spectrometry (GC/MS)

**LABORATORY :** Mass Spectrometry Unit  
**SUPERVISOR :** V. Taguchi

**SAMPLE TYPE :** drinking water, aqueous samples, soil, sediment

**PRINCIPLE OF THE METHOD :**

The method involves extraction of the organic components from their respective matrices with an organic solvent and analysis of the concentrated extract by gas chromatography / full scan mass spectrometry.

Drinking water and aqueous samples are initially adjusted to pH 12. The base/neutral components are serially extracted with dichloromethane. The remaining aqueous fraction is then adjusted to pH 2 and the acidic components are serially extracted with dichloromethane. The extracts are filtered through anhydrous sodium sulphate to remove water and then concentrated by rotary evaporator and a nitrogen evaporating unit. The final extracts are analyzed by GC/FS-MS.

Soil and sediment samples are extracted with toluene in a Soxhlet/Dean-Stark apparatus. The concentrated extracts are analyzed by GC/FS-MS.

The extractable organics are reported according to their compound names and compound classes. The concentrations of the components are approximate and are calculated relative to the internal standard.

**PARAMETERS MEASURED :**

extractable organics analyzable by GC/MS

**LIS TEST CODE :**

PBEXT

## REPORTING FORMAT :

The extractable organics are reported according to their compound names, CAS registry numbers and compound classes \*. The concentrations of all components are approximate and are reported in µg/L ( resp. ng/g for soil and sediment samples ) to one significant figure with the prefix "A-". The minimum reported concentrations (calculated relatively to the internal standard ) depend on sample matrix and range from 0.1 µg/L to 1 µg/L.

## QUALITY CONTROL :

The routine quality control operations monitor presence of potential interferences in the method blanks, relative extraction efficiencies ( surrogates ), instrumental performance ( MS tuning characteristics / autotune /, reference standard solution analysis ).

The ratio of d<sub>6</sub>-NDMA to the internal standard d<sub>10</sub>-phenanthrene is used to monitor extraction efficiencies (recoveries) of a polar compound relative to a non-polar compound and is also an indicator for chromatographic performance.

**REMARKS :** The performance of the method was periodically examined through performance audit samples program administered by LSB Quality Management Office.

**METHOD CODE :** SMY-E3189A.1

**METHOD TITLE:** The Determination of Volatile Organics in Drinking Water and Aqueous Samples by Purge-and-Trap Gas Chromatography / Mass Spectrometry (P&T/GC/MS)

**LABORATORY :** Mass Spectrometry Unit

**SUPERVISOR :** V. Taguchi

**SAMPLE TYPE :** drinking water, aqueous samples

**PRINCIPLE OF THE METHOD :**

The volatile organics are purged from the matrix with helium gas, isolated onto multi-layered trap(s) and then thermally desorbed and analyzed by gas chromatography / full scan mass spectrometry.

The volatile organics are reported according to their compound names and compound classes. The concentrations of the components are approximate and are calculated relative to the internal standard.

**PARAMETERS MEASURED :**

volatile organics analyzable by P&T/GC/MS

**LIS TEST CODE :**

PBVOL

**REPORTING FORMAT :**

The volatile organics are reported according to their compound names, CAS registry numbers and compound classes\*. The concentrations of all components are approximate and are reported to one significant figure with the prefix "A-". ## GLOSSARY OF TERMS

accuracy	proximity to the true value expressed as average percent recovery or average percent of expected
average (mean)	sum of the measurements divided by the number of measurements
between-run experiment	samples are prepared by different technicians, and the instrumental analyses take place under different calibrations of the analytical system
between-run r.s.d.	measure of reproducibility of a method
calibration solution	solution containing target analyte(s) for a particular method at concentration(s) that will produce response(s) falling within the linear range of the instrument. This solution is used to calibrate the instrument response with respect to the analyte concentration.
calibration check solution	solution which has composition similar to the calibration solution and which is prepared independently of calibration solution. It is used to check performance of the instrument, especially the validity of current calibration.
fortified method blank	synthetic sample prepared by adding known quantities of target analytes of the method to the interference-free matrix
internal standard	known amount of a compound, that is assumed to have identical chemical and physical properties with the analyte(s) of interest, is added to the sample prior to sample processing. The recovery of this compound from the sample is used for correction of the final results.
MDL	method detection limit. MDL marks the concentration level above which one can conclude that a measured result indicates the presence of analyte in the sample with a specified confidence (99%).
method code	Analytical Methods Catalogue Code used within Ontario Ministry of the Environment
percent recovery	ratio of the concentration obtained by the experiment to the theoretical concentration, multiplied by one hundred
performance charts	graphical presentation of the individual results of the analyses of fortified method blanks or internal standards. The x-axis on the chart represents the date, the y-axis outlines percent recovery. The average and 99% confidence limits are displayed as well.

relative standard deviation	measure of spread of a population. The square root of the squared sum of the measurements minus the sum of squared measurements, divided by the number of measurements minus one.
T value	level below which analytical results represent trace values; additional data are needed for valid interpretation ( see Code of Practice for Environmental Laboratories, September 1989, Ontario Ministry of the Environment )
upper and lower 99% confidence limit, UL (LL)	$UL (LL) = X + (-) t \times s$ X,s represent the average and the standard deviation of the replicate measurement; $t_{(n-1, \alpha=0.01)}$ is the Student's t-value appropriate for a 99% confidence level and the given number of degrees of freedom <u>n</u>
within-run experiment	samples are prepared and analyzed by a single technician, and the instrumental analyses take place within one calibration of the analytical system
within-run r. s. d.	measure of repeatability of a method
W value	minimum reported level ( see Code of Practice for Environmental Laboratories, September 1989, Ontario Ministry of the Environment )
